Person was bitten by, or their mucous membrane or non-intact skin was in contact with saliva or brain material from a possibly rabid animal. Exposure without contact (aerosol exposure)

- Treat Wound
- Assess circumstances of exposure
- Report bite to Animal Control or local Police Department

Was the animal captured?

Is the animal a skunk, bat, raccoon, fox or other wild animal at risk for rabies, or a sick domestic animal?

- Sacrifice animal
- Rabies test done at Health Department
- May consult with State Health Department.

Did the animal become ill or die during the quarantine

No Treatment Needed

- Give rabies immune globulin (RIG) at 20 IU/KG according to current ACIP recommendations
- Give five 1.0 ml doses of rabies vaccine intramuscularly in deltoid region on days 0, 3, 7, 14 & 28

DOMESTIC
- Was the attack provoked?
- Did the animal appear healthy?

WILD
- Consider rabid

Consult with Health Department

Was the animal a domestic or wild animal at risk for rabies?

Mrs. Pre-immunized individuals do not receive RIG, but do receive 2 doses of rabies vaccine intramuscularly at 0 & 3 days

* Rodents and rabbits are very low risk for rabies.
